THE JEAN MONNET LECTURES

At its meeting of 9 February 1977 in Florence, the Academic Council of the European University Institute decided to organize a series of major lectures to be delivered each year by outstanding figures from the scientific or political worlds, dealing with important issues of contemporary society.

At the request of the Academic Council, Mr. Jean Monnet kindly agreed to his name's being given to the lecture series.

The Right Hon. Roy Jenkins, President of the Commission of the European Communities, gave the inaugural lecture on 27 October 1977, on the theme: "Europe's present challenge and future opportunity".

SPEECH BY MR. MAX KOHNSTAMM

Principal of the European University Institute

Your Excellencies, Ladies and Gentlemen,

Allow me to begin by welcoming you on behalf of the Academic Council and by telling you how pleased we are that so many of you have come here for the inaugural Jean Monnet lecture. This is a historic day for the European University Institute and we are delighted to be surrounded by so many friends today.

Allow me to explain to you in a few words why we have given this annual lecture the name of Jean Monnet, and to introduce to you the speaker for the first Jean Monnet lecture, the Right Hon. Roy Jenkins.

There are very few men of whom one can say, "without him the European Community would not have existed". It can be said of Jean Monnet – and that is why we are so pleased that he has agreed to the lectures being given his name. It is not for me here today to describe the man and his work to you. Thanks to his memoirs, each one of us can now get to know him and understand why and how he did what he did. Allow me simply to express my profoundest admiration for that great statesman, who was a great statesman without ever forming part of a government, for that French peasant who is the first honorary citizen of Europe, for that man of action who was always

guided in his actions by a deep wisdom and by that rare kind of intelligence that is always able to select the essential, for that man with an iron will and an unflagging tenacity who is at the same time a great-hearted man, a man who has made all who have had the privilege to know him not only his admirers but also his friends.

It is to mark our deep gratitude and admiration for the man and his work that we are pleased and proud that he has kindly agreed to having this annual lecture series bear his name.

I have just received a telegram from Jean Monnet, from which I should like to read you the most important passages¹.

"At the opening of the lecture series to which you have kindly given my name, I send you all my best wishes for the prosperity of the European University Institute of which you are Principal.

For years now the need for such an institute to give our countries on the road to unification the facilities for joint research into their joint culture has been clear to us.

I am pleased that so many eminent men have already agreed to make their experience available to the research students in Florence, and I wish in particular to greet my friend Roy Jenkins who is your guest today. He can tell you better than anyone that our undertaking is a work that will go down in history, and that history is made up of the institutions that prolong the work of men.

It is a great joy to know that you are at this moment welcoming Roy Jenkins among the professors, students and friends of your university.

Please pass on my sincere greetings to all.

JEAN MONNET "

¹ The complete text is given on page 26.

If it is agreeable to you, we shall send on behalf of you all the following telegram to Jean Monnet:

" Dear Monsieur Monnet,

All of us gathered together here at the European University Institute to hear the first Jean Monnet lecture delivered by your friend Roy Jenkins are delighted to send you this testimony to our great admiration for the work that you have accomplished.

We thank you for your message and we assure you that your example will inspire our efforts in the future.

We send you our most respectful greetings ".

Mr. President, dear Roy, introducing you to this audience – in fact to any audience in Europe – is like carrying coals to Newcastle. No one could be more suitable than you to deliver the first Jean Monnet Lecture. You have served your country in positions of the highest responsibility – I shall mention only that you were Chancellor of the Exchequer and twice Secretary of State of the Home Department.

A man of deep convictions, you resigned from the deputy leadership of your party when its position clashed with your European convictions. But your country and your party could not afford to leave you on the back benches for long. The decision to leave the U. K. Parliament and Government in order to assume the Presidency of the European Commission must have been a very difficult one, but it is a decision for which Europe owes you the deepest gratitude.

But it is not only what you have done and continue to do as a politician and statesman that makes your presence here as first Jean Monnet Lecturer so appropriate. I am not alluding to your numerous honorary degrees, nor to prizes such as the Prix Charlemagne which have been so rightly awarded to you for your services to European Unity.

What I am thinking of is the long list of important publications you have to your name.

Your biographies of Sir Charles Dilke and Asquith – to mention only these two books – would make you the pride of the best history departments in the world.

May I, before passing the microphone to you, take two minutes to make two announcements that will interest the many friends of the European University Institute assembled here. The first is that we received the following telegram today:

" As first signatory I hereby inform you that a bill has been presented today, signed by Messrs Bucalossi, Mariotti, Depoi, Compagna, Malagodi, Raicich, Reggiani, Pezzati, to grant the European University Institute the necessary funds for additional conversion work and for purchasing ground and buildings to accommodate the students and teachers of the Institute.

Cordially

PIETRO BUCALOSSI "

My dear Mr. Bucalossi, I am particularly pleased to welcome you here today.

Allow me to pay sincere thanks, which I would ask you to pass on to the rest of those who have contributed to this bill, for your concern for the European University Institute.

The second announcement concerns next year's Jean Monnet Lecture. I am glad to inform you that this will be another statesman – who is also a historian and a political scientist – the former US Secretary of State Henry Kissinger.

Since I have kept the audience from hearing you for quite long enough now, my dear Roy, may I now give the floor to the Right Honourable Roy Jenkins, President of the Commission of the European Communities.

LECTURE DELIVERED BY THE RIGHT HONOURABLE
ROY JENKINS

President of the Commission of the European Communities

It is a great honour to have been asked to deliver this, the first, Jean Monnet Lecture here at the European University Institute in Florence. It is the first occasion on which I have been able to visit the Institute. It is young in years but has been established as an expression of the historic perspective of a still youthful European Community. It is appropriately set in one of the most historic and notable cities of Italy and Europe itself. But although I emphasise the youth of the Institute and I know that great traditions of scholarship and research do not spring up overnight, I hope and believe that the work which is going forward here under the wise direction of Professor Kohnstamm will lead to the achievement of an Institution which is both scholarly and imaginative, and of which Europe can be proud.

Before I turn to the substance of my speech to you this evening it is above all both right and relevant that I should say a few words to you about the man whom this lecture honours. I do not need to set out his many achievements. Indeed it would take a long time for Jean Monnet has had a life of many facets. This lecture honours its most outstanding feature, his work over many years towards European unity. This has been, and happily remains, a work

of inspiration, persuasion and organisation – a rare combination of personal qualities which has enabled him to make a unique contribution to both recent history and the future of Europe.

After nearly 89 years of his life Jean Monnet remains, as he has been throughout; impregably optimistic, but not utopian. He does not believe in miracles and although he believes that crucial moments of opportunity must never be lost, he gives more importance to patience and direction than to speed and the construction of false timetables. He is a man modest of manner and he has always been antipathetic to sharp and cruel comment. He has nearly always respected the motives of those who have disagreed with him. But these qualities have always been underpinned by an unshakable intellectual self-confidence. Those who opposed were misguided and should not so much be criticised as overcome or undermined by the patient deployment of the superior logic of careful argument, buttressed by the pressure of events.

The European Community, for which both in his public and private capacity he has done perhaps more than any other individual to create and sustain, has always moved forward most effectively when the spirit of these personal qualities I have described has been realised in practice. Particularly in periods when the sense of European advance is at its low ebb and when there is need for a determination to go forward and not be deflected his example is the most persuasive. He recalls as one of the most significant remarks he has ever heard a dictum of the American Dwight Morrow: "There are two kinds of people: those who want to be someone and those who want to do something". There is no doubt to which category he belongs. We honour him best by seeking to push forward, in his way, the work of the European Community. It is in that spirit that I intend today to present to you not a historical reflection on the

Community's history nor a conventional tour d'horizon of its contemporary problems but to set out to you a central area in which I believe we must now advance.

* * *

I would like to devote this first Jean Monnet Lecture, in this twentieth anniversary year of the Community, to a single major issue, but one which in its ramifications touches every aspect of European life. The hard, central core of the argument I shall develop turns around the case for monetary union. This, of course, is a familiar, rather than a novel concept. Despite its familiarity, it is neither popular nor well understood. But even for those for whom it is part of the normal landscape of economic theory and policy, what is very different compared to the last time the Community discussed the subject in any basic way is the state of the European and world economy, and the state of international monetary affairs. We need also to take a fresh view as to how monetary union should be allied with associated Community policies, and, more broadly, with the fundamental question as to how such an idea as monetary union fits with our view of the future division of functions between the Community and Member States.

This choice of subject does not imply a narrow economic view of the Community's function. It derives from the obvious fact that the most important weakness of the Community today is its central economic mechanism. Of course the Community has other primary functions. On the one hand it stands for a certain type of democratic and political society within Europe; on the other hand it stands as a viable political entity for dealing with a wide range of external relations.

On these two fronts, much remains to be done. But

despite the shocks and difficulties of the recent past, the outlook is one of activity and promise. We are engaged in underpinning our democratic political values, not only in preparing the first direct elections to a new European Parliament, but at the same time confronting sympathetically but realistically the potential adhesion of three new Member States – three states which have recently made the historic shift from military dictatorship to parliamentary democracy. We have in the last fortnight seen a great European nation combat with resilience and skill a major terrorist threat to individual freedom and the rule of law – those fundamental values for the strengthening of which the applicants have turned to Europe for sustenance.

In the world beyond, the Community has a solid record: the Lomé Convention, the Mediterranean agreements, and our response to the North/South dialogue. During the past six months, the Community has continued to move forward at the centre of major world negotiations. Indeed, such has been the advance that we face the somewhat paradoxical spectacle of Europe being taken more seriously from outside than from within. It is a paradox which, in my view, we cannot indefinitely sustain. Our size as a trading bloc conceals, rather than heals, our divisions and inequalities in the realm of economic performance. This cannot persist. The central economic weaknesses of Europe, if they continue, will not allow our external cohesion to grow, or even perhaps be maintained. Moreover, the prospect of enlargement will face us with the clear choice either of a strengthening of the sinews of the Community or of tacit acceptance of a loose Customs Union, far removed from the hopes of its founders, and without much hope of recovering momentum.

Some commentators believe the time is unpropitious for adventurous ideas. I do not agree. The concept and indeed the politics of monetary union stand immobilised in scepticism, following the demise of the Werner Plan, whose initial

exchange rate mechanism was shattered by the turbulent monetary events of the past few years.

The consequence has been an understandable shift of emphasis. The concept of gradualism, which has been more imperceptible than inevitable, has come to supplant more ambitious schemes. Some people seem to believe that we can back our way into monetary union; others that better coordination is all that is required. I am afraid neither view is right. The last few years have seen a retreat rather than an advance. In any event, the idea of an antithesis between gradual evolution and dramatic advance is misconceived. Evolution is a process which once begun goes both gradually and in jumps. There is room for *tomorrow's* act of better coordination and for *today's* discussion of a more ambitious plan for *the day after tomorrow*. The process has to be seen as one. Examples are the Community's role in helping to restructure basic industries that are at present in deep economic difficulty, and measures to abolish the remaining effective frontiers to the free movement of goods and services.

We must now look afresh at the case for monetary union because there are new arguments, new needs, and new approaches to be assessed, which go to the heart of our present apparently intractable problems of unemployment, inflation and international financing. There are no less than seven arguments that I would like to put forward for your consideration. The first and the seventh are classical, but none the less valid for that. The remaining five, however, are all practical points that need to be formulated differently from the way in which they were presented in the early nineteen seventies.

Basic to the case is the ineluctable internationalisation of western economic life. This has been a long and gradual process, but one which has been unmatched by a comparable evolution in the economic institutions of the Community.

The past four years has shown the limitations in Europe even of good national economic policies. This has been superimposed on the revolutionary effect of the oil crisis – that sharp confirmation of the end of the old international monetary order which added the hazard of a massive overhang of maldistributed and largely uncontrolled international liquidity to an already vulnerable European economy.

No proposition as radical as monetary union in Europe can be achieved at a stroke. My belief is that we should use the period immediately prior to the first direct elections of the European Parliament to re-launch a major public debate on what monetary union has to offer. In doing so, we have to reckon with the problems of how to get from where we are to where we want to go and what must necessarily accompany monetary union if it is to appeal equally to strong and weak economies, to the richer and poorer parts of the Community.

I wish today to outline the major criteria by which the case has to be judged. I expect no easy consensus on the problems it raises, several of which are either at the heart of what is most controversial in modern economic theory, or the most debatable – in the best sense – in political terms. The debate must now be re-opened and subsequently sustained. It will not be quickly foreclosed.

The first argument is that monetary union favours a more efficient and developed rationalisation of industry and commerce than is possible under a Customs Union alone. This argument is as valid now as it has always been, and is reflected in the repeated attempts in European history to form monetary unions – for example the Austro-German monetary union of 1867, the Latin monetary union led by France in 1865, and the Scandinavian union of 1873. Somewhat later sterling operated a different kind of imperial monetary union over large and disparate parts of the globe. But that is history, although relatively recent history. To

return to the present day, discussion with businessmen across Europe produces a clear and consistent complaint that it is difficult, almost impossible, to plan a rational European dimension to their enterprises with the present exchange rate risks and inflation uncertainties as between Member States. The same complaint is often heard from those outside who wish to increase their investment in and trade with Europe. This means that the potential benefits of the Community as a common market are far from fully achieved.

The second argument is based on the advantages of creating a major new international currency backed by the economic spread and strength of the Community, which would be comparable to that of the United States, were it not for our monetary divisions and differences. The benefits of a European currency, as a joint and alternative pillar of the world monetary system, would be great, and made still more necessary by the current problems of the dollar, with its possible de-stabilizing effects. By such a development the Community would be relieved of many short-run balance of payments preoccupations. It could live through patches of unfavourable trading results with a few points drop in the exchange rate and in relative equanimity. International capital would be more stable because there were fewer exchange risks to play on, and Europe would stand to gain through being the issuer of a world currency. National balance of payments problems, in the sense that these are experienced today by the Community's Member States, would be largely removed as an immediate constraint on economic management. There would still be major financial questions to be resolved, between regions, and between Member States, and to these I will return in a moment; but the essential point is that economic welfare in Europe would be improved substantially if macro-economic policy was not subject to present exchange rate and external financial risks.

They hang as a sword of Damocles over the heads of many of our countries in Europe today.

It will rightly be argued at this point that sound financial policies are in any case necessary for all countries and that we cannot escape from the need for certain universal disciplines by relocating the level of certain economic policy powers. I myself advocate prudent financial policies, and indeed was accused in the past as a British Chancellor of the Exchequer of that most terrible of sins – excessive prudence. But this is not an argument counter to my main thesis. The relevant question is what degree of reward will the public receive as a result of wise and even courageous policies on the part of its governments; or, put another way, what will be the penalties inflicted on our people by a largely anonymous international monetary system which amplifies beyond all proportion any ill-fortune of a political or economic nature.

My argument is that it is within our power to change, profoundly and to our advantage, the scale of rewards and retributions administered by the world monetary disorder. We should take it upon ourselves to redesign and restore a large part of that system. In the Community we have the political framework within which a workable alternative could be achieved if we so wish, and if we have the will. The Community is the right size of unit for monetary policy in the particular setting of our highly interdependent, closely packed, advanced industrialised societies. At the world level or inter-continental level there is probably no real alternative to floating exchange rates; nor indeed is this system such a bad one in that very different context where the units of economic management are widely separated by distance, or society, or political system, or living standards, or several of these factors together.

My third argument concerns inflation. It is fairly certain that monetary union would radically change the present

landscape by leading to a common rate of price movement. But I would also like to argue, although I accept this to be more controversial, that monetary union could help establish a new era of price stability in Europe and achieve a decisive break with the present chronic inflationary disorder. Of course the sources of contemporary inflation are diverse, and prominent among these are what may seem to be essentially domestic and highly political struggles over income distribution. But let us suppose at some stage a currency reform: the issue of a new single currency by a European monetary authority; and adoption by this authority of a determined and relatively independent policy of controlling note issue and bank money creation. The authority would start by adopting target rates of growth of monetary expansion consistent with a new European standard of monetary stability, following the best traditions of our least inflationary Member States. This would of course mean that national governments lost some considerable control over some aspects of macro-economic policy. But governments which do not discipline themselves already find themselves accepting very sharp surveillance from the International Monetary Fund, a body far further away from them and less susceptible to their individual views than is the Community. Furthermore, I must make it clear that my arguments are not addressed to those who would prefer to fail alone rather than succeed together. Attitudes such as theirs inevitably cause deaf ears. I am concerned with those who want to see a successful and strengthened Community, but also expect to be convinced of the practical benefits of any move forward.

We have to remember what is new about the problem of inflation compared with that to which we were accustomed in the fifties and sixties. Floating exchange rates transmit violent and sudden inflationary impulses, which may strike a country at any moment, perhaps just at the time when

employers, trade unions and government may be endeavouring to put or hold together a courageous and delicate stabilization programme.

Each new impulse ratchets up the inflationary process. The price rise effect on the devaluing country is much more than the price reduction effect on the revaluing currency because wages, and therefore a large part of costs, cannot be reduced in nominal terms.

Exchange rates may rise and fall, but the price level in all recent experience only goes up. The exchange rate problem feeds in turn the psychology of inflation – the high level of inflationary expectations now endemic in many of our own countries, leading to the danger, only recently averted in some Member States, of hyperinflation – that condition in which, almost in the time it takes to walk from bank to shop, the product you planned to buy has become too expensive. Of course, there are conventional responses for trying to contain and reduce the pressures of inflation. But monetary union and reform stands available as the radical treatment for this disease. I do not pretend that the cure would be complete. For example, we would still have to reckon with the inflationary effects of reconciling competing claims on limited resources. The disciplines of monetary union will be more, not less demanding. The change in inflationary behaviour would not have to be greater than that observed in some recent stabilisation policies, but it would have to be permanent. The legitimate needs of the weaker regions would have to be met far more powerfully than is at present the case. I will return to this point in a moment. But the counterpart must be that wages across countries would remain in some kind of reasonable relationship to productivity: here the legitimate concern of the stronger regions and less inflationary states would also have to be met.

The fourth argument concerns employment: no medium

term recipe for reducing inflation which does not have a beneficial effect upon employment is now acceptable. Present levels of unemployment are the most damaging and dangerous social ill that confront us. At best they produce a self-defeating nationalistic caution and immobilism. At worst they threaten the stability of our social and political systems. We now have six million unemployed in the Community. Many have been surprised at the apparent tolerance of our populations to this level. Typically in our larger Member States the level of one million unemployed long figures as some kind of post-war political barrier. The unthinkable has been surpassed without catastrophe — as yet. But no-one should be so complacent as to suppose that this state of affairs can long persist without doing irreparable damage: to the well-being of the millions of families directly affected by unemployment, to the morale and motivation of a whole generation of young people, to stability and consensus in our societies.

In economic terms, I believe that our unemployment problem is essentially one of demand deficiency stemming from the constraints on our ability to cause a smooth, powerful, sustained ground-swell of demand. I do not accept that Europe's capacity for creating new wealth, providing new employment and stimulating growth in the right direction is at an end. Environmental factors and the energy crisis mean that we have to look at the nature of our growth. In any event we need increased output to pay for the present price of oil and for the replacement or adaptation of industrial processes that were designed for lower energy prices and lower environmental standards.

These structural and monetary problems combine to make present levels of unemployment highly intractable. But they should not be seen as justifying defeatist and misconceived policies which would permanently reduce the economic potential of the European economy: for example excess-

ive reduction in working hours or compulsory retirement at 55.

We also need to view the present economic recession in a longer-term perspective. The extent and persistence of unemployment can no longer be seen as an exceptionally low and long bottom to the business cycle. To restore full employment requires a new impulse on a historic scale. We require a new driving force comparable with the major rejuvenations of the past two hundred years; the industrial revolution itself, the onset of the railway age, the impact of Keynes, the need for post-war reconstruction, the spread of what were previously regarded as middle-class standards to the mass of the population in the industrial countries. I believe that the needs of the Third World have a major part to play here. Two sources of new growth have in the past sometimes come together, the one world-wide, and the other regional.

Can we contemplate the prospect of European monetary union in this context? I believe that we can and should.

There is already broad agreement on what we need for a fundamental turn in the tide of Europe's employment prospects:

- there has to be confidence in steady and more uniform economic policies favouring investment and expansion;

- there has to be a strengthening of demand with a wide geographical base;

- if inflation is to continue, it must be at a lower and more even rate than Europe has known in recent years;

- we have to ensure that spasmodic, local economic difficulties will not be magnified by exchange rates and capital movements into general crises of confidence.

These four requirements may seem obvious enough. The challenge is how to change radically and for the better the

institutional weaknesses that have been hindering our ability to restore high employment in conditions of price stability and a sound external payments position. I believe that monetary union can open perspectives of this kind.

My argument is not that the Community ought to make some new choice on the combination of these three objectives, still less that we should seek to impose a caricature of some country's traditional preference on the rest of the Community. Economists have now spent years tracking the deteriorating inflation-employment relationship and the deteriorating effectiveness of exchange rate changes in the balance of payments adjustment process. The decisions now required are political rather than simply economic; and I hope that these would in years ahead come to be recognised by economists as a break-out from their accepted systems and current models. In this process, we need also to discard political argument based on obsolete, inadequate, or irrelevant economic theory: that the objections to European integration are the differing preferences on inflation and unemployment as between Member States, and that floating exchange rates within Europe allow each country to achieve on its own a happily optimal outcome of its own preference. This is not how the world really is, and we all know it.

The fifth argument to which I now turn concerns the regional distribution of employment and economic welfare in Europe. Monetary union will not of itself act as some invisible hand to ensure a smooth regional distribution of the gains from increased economic integration and union. Those who have criticised a purely liberal model of the Community economy, one that aims to establish perfect competition and do no more, have strong arguments on their side.

But the Community of today bears no relation to the laissez-faire caricature of some of its critics. Nor does it correspond to the model I suggest we should now contemplate for a monetary union. All our Member States find

themselves obliged to redistribute large sums of public money and to use less strong but more overt regional policy measures to secure a reasonable distribution of national wealth and employment.

In the Community of today, we have a battery of financial instruments, but all of them rather small guns: the Regional and Social Funds, the Coal and Steel Community's financial powers, the European Investment Bank and the Guidance Section of the Agricultural Fund. The Commission has recently made a number of decisions and proposals for the coordination and expansion of these operations. These are worthwhile developments in themselves, and they go in the right direction. But their scale is small in relation both to current needs and to the financial underpinning that would be required to support a full monetary union. This is an example of how short-term practical needs and the demands of a longer-term perspective march alongside each other. There is no contradiction in modern integrated economies.

The flow of public finance between regions performs several essential functions:

- first, it improves the infrastructure and promotes industrial investment in the poorer areas;
- second, it evens out cyclical swings in the performance of individual regions;
- third, it assures minimum standards in basic services;
- fourth, it sustains a pattern of regional balance of payments surpluses and deficits which are of a different and larger order of magnitude than those which would cause crises if they existed between countries.

This represents the principal offsetting factor compensating the region of state for its inability to conduct a distinct exchange rate or monetary policy.

Europe must think in terms of the same economic logic. If the Community is to take seriously its declared aim of monetary union – and there are great dangers in having declared aims which are not taken seriously – it is indispensable that an associated system of public finance should also be envisaged. The weak regions of the Community must have a convincing insurance against the fear that monetary union would aggravate their economic difficulties. The strong regions must for their part have a counterpart in terms of more stable, secure and prosperous markets. Their interest in the underpinning of the unity of the market is overwhelming. In the context of the enlarged Community, it should also be made clear that we are here talking of the means whereby we can avoid or reduce excessive movement of people from poorer to richer areas. This could all too easily lead to the further impoverishment of one and the intolerable congestion of the other.

The Community must also take a realistic view of the degree of convergence in economic performance which should be expected before and after the creation of a monetary union. On price performance, monetary union has unpromising effects. Inter-regional differences in living standards cannot be dealt with so drastically. But we should not be too discouraged. The United States of 50 years ago had a greater degree of regional inequality than the Community has today. 100 years ago it was almost certainly greater still. This analogy should not be pushed too far, but it is nonetheless of considerable interest.

The sixth argument concerns institutional questions, the level at which decisions have to be made, or the degree of decentralisation that we should seek to maintain in the Community. Monetary union would imply a major new authority to manage the exchange rate, external reserves and the main lines of internal monetary policy.

The public finance underpinning of monetary union

which I have just described would involve a substantial increase in the transfer of resources through the Community institutions. The question then is: can monetary union be reconciled with the profound pressures that are manifest in almost all our Member States in favour of more, rather than less, decentralised government? I believe the answer can and should be yes. But this requires us to envisage a very special and original model for the future division of functions between levels of government. This is not a subject that has been considered at all systematically in the Community in the two decades which have passed since the Treaties of Paris and Rome laid down certain sectors of Community competence. Monetary policy can only be decentralised to a very limited degree. But for most policies requiring public expenditure, the reverse is the case. The vast growth of public expenditure in the post-war period, now approaching half of GNP, has emphasised the need for multi-tiered government with various levels according to country: local, regional, state, national, etc. This is a natural and healthy development. It avoids a monolithic concentration of political and economic power and allows for more efficient specialisation by level of government. It also associates people more closely with the decision-making process.

The federal model is clearly only one in a number of possibilities for multi-tiered government. Some support the federal model; others would prefer something confederal; others like neither. I for my part believe that the Community must devise its own arrangements and that these are unlikely to correspond to any existing prototype. We must build Europe upon the basis of our late twentieth century nation states. We must only give to the Community functions which will, beyond reasonable doubt, deliver significantly better results because they are performed at a Community level. We must fashion a Community which gives to each Member State the benefits of results which they

cannot achieve alone. We must equally leave to them functions which they can do equally well or better on their own.

I would like to give an example of why Europe should not think in terms of copying existing models. The U. S. Federal Government grew enormously in importance when it pushed the development of the social security system, because the states would not move forward quickly enough, and because some states were notable laggards. By contrast, our national social and welfare services, while neither perfect nor identical, are highly developed and not dissimilar. In most Member States social and welfare expenditure amounts to around 25% of GNP. This is a massive example of how the European model of government has no need to contemplate developing Community expenditure of a traditional federal scale.

I believe that we can identify those functions which make sense for Europe: those aspects of external relations where inter-continental, bargaining power is called for; certain research and development functions which offer economies of scale at the level of 250 million people; policies relating to industrial sectors which have a natural European dimension either because they involve high-level economies of scale as in the case of aerospace or electronics; or because they are closely linked with trade policy, as it the case with industries in trouble with excess capacity like steel, textiles and ship-building; or because the areas involve strategic interests which are indivisible between Member States, as in the case of energy policy. Last we need financial policies that would help support the integration of the European economy, the maintenance of regional balance, and thus the viability of monetary union.

The overall magnitude of budgetary spending at the European level for this type of Community has recently been estimated by a group of independent economists under the chairmanship of Sir Donald McDougall. As against present

Community expenditure of the order of 1% of GNP, they estimated that very substantial progress on economic integration could be achieved with the aid of expenditure of 2 to 2½% of GNP; they believed that a definitive monetary union might be viable with expenditure of the order of 5 to 7% GNP. These are of course very large sums of money, which would have to be built up gradually by a transfer of some expenditure from national budgets and not by a superimposition, but they are quite small by the standards of the classic federations where the top tier of government takes 20 to 25% of GNP.

There is therefore for the Community a new and realistic model for a highly decentralised type of monetary union in which the public procurement of goods and services is primarily in national, regional or other hands. The public finance function of such a Community would be stripped down to a few high-powered types of financial transfer, fulfilling specific tasks in sectors of particular Community concern, and assuring the flow of resources necessary to sustain monetary union. These characteristics also make for a quite small central bureaucracy, which I think we would all consider an advantage.

But the political implications would also be great. We must be frank about this. The relocation of monetary policy to the European level would be as big a political step for the present generation of European leaders as for the last generation in setting up the present Community. But we must face the fundamental question. Do we intend to create a European union or do we not? Do we, confronted with the inevitable and indeed desirable prospect of enlargement, intend to strengthen and deepen the Community, or do we not? There would be little point in asking the peoples and governments of Europe to contemplate union, were it not for the fact that real and efficient sovereignty over monetary issues already eludes them to a high and increasing

degree. The prospect of monetary union should be seen as part of the process of recovering the substance of sovereign power. At present we tend to cling to its shadow. These arguments do not run against international cooperation, as for example in the OECD and the IMF. On the contrary, we need to improve the functioning of the international economy by a better shaping of its constituent parts. Monetary disunity in Europe is one of the major flaws in the international system as well as in the functioning of our small to medium-sized states.

On the seventh and final argument, I can be quite short since, like the first, it is a traditional one. It is the straight political argument that monetary union stands on offer as a vehicle for European political integration. Jacques Kueff said in 1949 " L'Europe se fera par la monnaie ou ne se fera pas ". I would not necessarily be quite so categorical. It should, however, be clear that the successful creation of a European monetary union would take Europe over a political threshold. It seems equally clear that Europe today is not prepared to pursue the objective of monetary union uniquely for ideological reasons. To move in this direction Europe also needs materially convincing arguments. I have tried to set out some of the economic arguments.

I summarise as follows. We must change the way we have been looking at monetary union. A few years ago we were looking at a mountain top through powerful binoculars. The summit seemed quite close, and a relatively accessible, smooth, gradual and short approach was marked out. But then an avalanche occurred and swept away this route. The shock was such that more recently it has even seemed as if we have been looking at the summit with the binoculars both the wrong way round and out of focus.

I believe that a new, more compelling and rewarding but still arduous approach is necessary. We must also change the metaphor. Let us think of a long-jumper. He starts

with a rapid succession of steps, lengthens his stride, increases his momentum, and then makes his leap.

The creation of a monetary union would be a leap of this kind. Measures to improve the Customs Union and the free circulation of goods, services and persons are important steps. We look for bigger strides in working out external policies, establishing more democratic and thus accountable institutions, elaborating more coherent industrial and regional policies, and giving our financial instruments the means to keep the whole movement on a balanced course. We have to look before we leap, and know when we are to land. But leap we eventually must.

We must not only do what is best in the circumstances. We must give our people an aim beyond the immediately possible. Politics is not only the art of the possible, but as Jean Monnet said, it is also the art of making possible tomorrow what may seem impossible today.

TELEGRAM FROM MR. JEAN MONNET
TO MR. MAX KOHNSTAMM

Principal of the European University Institute

Dear Principal and Friend,

At the opening of the lecture to which you have kindly given my name, I send you all my best wishes for the prosperity of the European University Institute of which you are Principal.

For years now the need for such an institute to give our countries on the road to unification the facilities for joint research into their joint culture has been clear to us.

You have laboured patiently and with conviction to lay the grounds for this European University which is destined to become a laboratory of ideas for the Communities at work. I am pleased that so many eminent men have already agreed to make their experience available to the research students in Florence, and I wish in particular to greet my friend Roy Jenkins who is your guest today. He can tell you better than anyone that our undertaking is a work that will go down in history, and that history is made up of the institutions that prolong the work of men.

The Institution over which he presides has given proof

of its solidity. It has adapted to changing circumstances and it has assured itself of an influx of new blood in successive generations.

I saw the foundation of the first European Community, where you, my dear Kohnstamm, joined me from the first days, and it is a great joy to know that you are at this moment welcoming Roy Jenkins among the professors, students and friends of your University.

Please pass on my sincere greetings to all.

JEAN MONNET
